ANALYSIS OF BLOOD SAMPLES FOR PERFLUOROOCTANOATE (Job No. 811-610; PRAL Nos. 81-1763-1777; Notebook Nos. E22514, E26238)

As requested in your letter of 4/23/81 to L. J. Papa, the 15 blood samples submitted then have been analyzed for perfluorooctanoate (Cg). Results and sample identification are given in the attached table.

As noted there, the analyses were done using a gas chromatographic method specific for Cg (Lab Method Number ES-567) but results have been reported as ppm F for comparison with total organic fluorine analyses. Precision is + 10% relative standard deviation over most of the concentration range, somewhat less at the lowest values. The lower limit for quantitation is 0.007 ppm F (0.01 ppm perfluoroctanoic acid), with a detection limit of  $\sim$  0.004 ppm which can be distinguished from the reagent background but not well quantitated.

Please contact me (772-4440) or L. J. Papa (772-2745) if you have any questions regarding the analyses. General questions on blood sampling can be directed to J. W. Raines or L. F. Percival.

- (a) Analysis as described in Lab Method ES-567 ("Determination of Perfluorooctanoic Acid in Blood, Gas Chromatographic Method", S. Stafford, 4/3/81,), using the packed column GC analysis with perfluoro-n-octanoic acid as calibration standard.
- (b) Although the analysis is specifically for perfluorooctanoate (acid or salts), concentrations are given in ppm fluorine for comparison with the results of total organic fluorine analyses. (ppm F = 0.688 x ppm perfluorooctanoic acid) Estimated uncertainty is  $\pm$  10% relative standard deviation. The lower limit for quantitation is 0.007 µgF/g. The detection limit is  $\sim$  0.004 µgF/g, but concentrations in that range cannot be well quantitated and are reported as < 0.007. None detected (n.d.) is reported for samples with [Cg]  $\lesssim$  0.004 ppm, which cannot be distinguished from reagent background.
